We are living in a time of rapid change. Technology is changing the way we work and communicate, financial institutions are becoming more aware of environmental issues, and businesses are using artificial intelligence to improve their operations. At the same time, issues such as women's representation, financial inclusion, employment skills, and environmental responsibility continue to be important for society. Green finance is connected with sustainable development. Education is connected with the green workforce. Digital media is connected with economics, branding, culture, and representation. Financial inclusion is connected with community development.

Technology brings both opportunities and challenges. *"Artificial Intelligence: A Path to Ecocidal Consequences"* raises an important question about the environmental impact of artificial intelligence. Other articles in this issue show how artificial intelligence can be used positively in business and finance. *"Vendor Invoice Intelligence System using Machine Learning for Cost Prediction and Risk Detection"* explores how machine learning can help organizations manage invoices, predict costs, and identify possible risks. Similarly, *"FraudShield AI: A Real-Time Financial Fraud Detection System Using Machine Learning and Scalable Web Architecture"* focuses on the use of AI to detect financial fraud quickly

We sincerely appreciate all the readers, authors, reviewers, and contributors who have shared their expertise and helped make this issue possible. We hope that this collection of research will provide useful knowledge, encourage discussion, and inspire further research.
